

In order to reduce the GC content of the 5' terminus of asp2, a pair of antiparallel oligos were designed to change degenerate codon bases in 15 amino acid positions from G/C to A/T (SEQ ID Nos. 25 and 26). The new nucleotide sequence at the 5' end of asp2 did not change the encoded amino acid and was chosen to optimize E. Coli expression. The

sequence of the sense linker is 5'

CGGCATCCGGCTGCCCCCTGCGTAGCGGTCTGGGTGGTCTCCACTGGGTCTGCG
TCTGCCCCGGGAGACCGACGAA G 3' (SEQ ID No. 39). The sequence of the antisense
linker is : 5'

CTTCGTCTGGTCTCCCGGGGAGACGACGACCCAGTGGAGCACCACCCAGACCG

CTACGACGGGGGAGCCGGATGCCG 3' (SEQ ID No. 40). After annealing the
phosphorylated linkers together in 0.1 M NaCl-10 mM Tris, pH 7.4 they were ligated into
unique Cla I and Sma I sites in *Hu-Asp2* in the vector pTAC. For inducible expression
using induction with isopropyl b-D-thiogalactopyranoside (IPTG), bacterial cultures were
grown in LB broth in the presence of ampicillin at 100 ug/ml, and induced in log phase
growth at an OD600 of 0.6-1.0 with 1 mM IPTG for 4 hour at 37°C. The cell pellet was
harvested by centrifugation.

To create a vector in which the leader sequences can be removed by limited
proteolysis with caspase 8 such that this liberates a *Hu-Asp2* polypeptide beginning with
the N-terminal sequence GSFV (SEQ ID Nos. 27 and 28), the following procedure was
followed. Two phosphorylated oligonucleotides containing the caspase 8 cleavage site
IETD, #571=5'

GATCGATGACTATCTCTGACTCTCCGCTGGACTCTGGTATCGAAACCGACG
(SEQ ID No. 41) and #572=

GATCCGTCGGTTTCGATACCAGAGTCCAGCGGAGAGTCAGAGATAGTCATC

(SEQ ID No. 42) were annealed and ligated into pET23a+ that had been opened with
BamHI. After transformation into JM109, the purified vector DNA was recovered and
orientation of the insert was confirmed by DNA sequence analysis. +, the following
oligonucleotides were used for amplification of the selected *Hu-Asp2* sequence:

#573=5'AAGGATCCTTTGTGGAGATGGTGGACAACCTG, (SEQ ID No. 43)

#554=GAAAGCTTTCATGACTCATCTGTCTGTGGAATGTTG (SEQ ID No. 44) which
placed BamHI and HindIII sites flanking the 5' and 3' ends of the insert, respectively. The
Asp2 sequence was amplified from the full length *Asp2* cDNA cloned into pcDNA3.1
using the Advantage-GC cDNA PCR [Clontech] following the manufacturer's supplied

5 protocol using annealing & extension at 68°C in a two-step PCR cycle for 25 cycles. The
insert and vector were cut with BamHI and HindIII, purified by electrophoresis through an
10 agarose gel, then ligated using the Rapid DNA Ligation kit [Boehringer Mannheim]. The
ligation reaction was used to transform the E. coli strain JM109 [Promega] and colonies
15 were picked for the purification of plasmid (Qiagen, Qiaprep minispin) and DNA sequence
analysis. For inducible expression using induction with isopropyl b-D-
thiogalactopyranoside (IPTG), the expression vector was transferred into E. coli strain
20 BL21 (Stratagene). Bacterial cultures were grown in LB broth in the presence of ampicillin
at 100 ug/ml, and induced in log phase growth at an OD600 of 0.6-1.0 with 1 mM IPTG for
25 4 hour at 37°C. The cell pellet was harvested by centrifugation

To assist purification, a 6-His tag can be introduced into any of the above constructs
20 following the T7 leader by opening the construct at the BamHI site and then ligating in the
annealed, phosphorylated oligonucleotides containing the six histidine sequence
#565=GATCGCATCATCACCATCACCATG (SEQ ID No. 45),
25 #566=GATCCATGGTGATGGTGATGATGC (SEQ ID No. 46). The 5' overhang for each
set of oligonucleotides was designed such that it allowed ligation into the BamHI site but
not subsequent digestion with BamHI.

Preparation of Bacterial Pellet:

30 36.34g of bacterial pellet representing 10.8L of growth was dispersed into a total
volume of 200ml using a 20mm tissue homogenizer probe at 3000 to 5000 rpm in 2M KCl,
0.1M Tris, 0.05M EDTA, 1mM DTT. The conductivity adjusted to about 193mMhos with
35 water.
After the pellet was dispersed, an additional amount of the KCl solution was added,
bringing the total volume to 500 ml. This suspension was homogenized further for about 3
40 25 minutes at 5000 rpm using the same probe. The mixture was then passed through a Rannie
high-pressure homogenizer at 10,000psi.

In all cases, the pellet material was carried forward, while the soluble fraction was
45 discarded. The resultant solution was centrifuged in a GSA rotor for 1hr. at 12,500 rpm. The
pellet was resuspended in the same solution (without the DTT) using the same tissue
30 homogenizer probe at 2,000 rpm. After homogenizing for 5 minutes at 3000 rpm, the
volume was adjusted to 500ml with the same solution, and spun for 1hr. at 12,500 rpm.
50 The pellet was then resuspended as before, but this time the final volume was adjusted to

5 1.5L with the same solution prior to homogenizing for 5 minutes. After centrifuging at the same speed for 30 minutes, this procedure was repeated. The pellet was then resuspended into about 150ml of cold water, pooling the pellets from the six centrifuge tubes used in the GSA rotor. The pellet was homogenized for 5 minutes at 3,000 rpm, volume adjusted to 10 250ml with cold water, then spun for 30 minutes. Weight of the resultant pellet was 17.75g.

Summary: Lysis of bacterial pellet in KCl solution, followed by centrifugation in a GSA rotor was used to initially prepare the pellet. The same solution was then used an additional three times for resuspension/homogenization. A final water wash/homogenization was then performed to remove excess KCl and EDTA.

Solubilization of rHuAsp2L:

A ratio of 9-10ml/gram of pellet was utilized for solubilizing the rHuAsp2L from the pellet previously described. 17.75g of pellet was thawed, and 150ml of 8M guanidine HCl, 5mM β ME, 0.1% DEA, was added. 3M Tris was used to titrate the pH to 8.6. The pellet was initially resuspended into the guanidine solution using a 20mm tissue homogenizer probe at 15 1000 rpm. The mixture was then stirred at 4°C for 1 hour prior to centrifugation at 12,500rpm for 1 hour in GSA rotor. The resultant supernatant was then centrifuged for 30min at 40,000 x g in an SS-34 rotor. The final supernatant was then stored at -20°C, except for 50ml.

Immobilized Nickel Affinity Chromatography of Solubilized rHuAsp2L:

The following solutions were utilized.

- A) 6M Guanidine HCl, 0.1M NaP, pH 8.0, 0.01M Tris, 5mM β ME, 0.5mM Imidazole
A') 6M Urea, 20mM NaP, pH 6.80, 50mM NaCl
B') 6M Urea, 20mM NaP, pH 6.20, 50mM NaCl, 12mM Imidazole
C') 6M Urea, 20mM NaP, pH 6.80, 50mM NaCl, 300mM Imidazole

Note: Buffers A' and C' were mixed at the appropriate ratios to give intermediate concentrations of Imidazole.

The 50ml of solubilized material was combined with 50ml of buffer A prior to adding to 100-125ml Qiagen Ni-NTA SuperFlow (pre-equilibrated with buffer A) in a 5 x 10cm Bio-Rad econo column. This was shaken gently overnight at 4°C in the cold room.

Chromatography Steps:

- 1) Drained the resultant flow through.
- 2) Washed with 50ml buffer A (collecting into flow through fraction)
- 3) Washed with 250ml buffer A (wash 1)
- 4) Washed with 250ml buffer A (wash 2)
- 5) Washed with 250ml buffer A'
